

MARS! / SCIENTIFIC MISSION

MISSION No.

00

RED DUST CITY

SETUP HABITAT AFTER TOUCHDOWN

CENTRAL QUESTION

What does it take to turn an empty shell into a habitat that keeps us alive and connected?

MORNING

HABITAT – UNPACK, CHECK, BUILD

- Walk through every module together and compare what is there with the packing list.
- Unpack and stow the supplies: water, food rations, medical kits, fire extinguishers.
- Set up the areas: sleeping, kitchen, research, hygiene, storage.
- Who sleeps where? Where does each thing belong?

POWER – FIRST LIGHT

- Lay the cables, connect battery and power bike.
- Switch circuits on one by one; label every socket.
- Read the meters and note the first values.
- What has to run all the time, and what can wait?

AFTERNOON

SCENOGRAPHY – MAKING IT A PLACE

- Set up the lights, the signs and the crew's corners.
- Hang the mission plan and the day's schedule.
- Look at the habitat from outside: what do visitors see first?
- What makes it feel like Mars, and what like home?

COMMUNICATION – FIRST CONTACT

- Connect the ground station: network, laptop, message board.
- Set up cameras and livestream; check the sound.
- Send a first message to Earth; wait for the answer.
- How long does it take? What gets lost on the way?

EVA

TEST EVERYTHING

Go round the habitat, inside and out, with the checklist:

- sensors: oxygen, CO₂, temperature, humidity
- power: sockets, meters, battery, power bike
- communication: network, cameras, livestream
- water, light, doors, emergency exit
- Mark each point: works / partly / does not work.

Ask: What would we notice first if something failed, and who repairs what, with which tools?

QUESTION FOR THE COMMUNITY HOUR

What is the first thing you would set up in a new home far away?

Was würdest du an einem neuen Ort weit weg als Erstes einrichten?

MATERIAL – WHAT DOES THIS NEED

Packing list, toolbox, cable ties, gaffa tape, extension leads, power meters, power bike, laptop, router, cameras, labels
