

MARS! / SCIENTIFIC MISSION

MISSION No.

12

RED DUST CITY

TRUST THE SYSTEM (?)

CENTRAL QUESTION

Do you trust machines over your own senses?

MORNING

SITUATION SCENARIOS – check measured values / presentation:

“Die Luft ist schlecht” (“The air is bad”).

“Die Heuschrecken frösteln” / “The grasshoppers are freezing.”

“Der CO₂-Wert ist gestiegen” (“The CO₂ level has risen”).

Ask:

- Is it true / false?
 - Where do I get that from?
 - How sure am I?
- Compare with measured values.

AFTERNOON

TWO INFORMATION SOURCES: own perception vs. sensors

Science Officer deliberately seeks discrepancies between measurement and perception, describes and reflects which information source they trust more and why.

Example: The air feels really stale, although O₂ and CO₂ sensors say everything is in order

→ technical systems / objects: more objective, precise, competent?

3. TRUST PROTOCOL

Formulate common rules:

- “We trust the system when ...”
- “We question the system if ...”
- “We override ...”
- “We verify ...”
- “We never rely on ...”

EVA

SYSTEMATICALLY LOOK FOR SIGNS / RULES

- traffic signs
- stop signs
- house numbers
- warning signs
- opening hours
- signs / markings

Ask:

- What does the sign mean?
- Why do we obey / follow the sign?
- What happens if we ignore it?
- Who decides what this sign means?

QUESTION FOR THE COMMUNITY HOUR

Would you trust a machine when it tells you that everything is in order?

Würdest du einer Maschine vertrauen wenn sie dir sagt dass alles in Ordnung ist?

MATERIAL – WHAT DOES THIS NEED

Paper / pen or laptop; voice recorder; photo paper; photo printer; sensors (Habitat).
