

MARS! / SCIENTIFIC MISSION

MISSION No.

7

RED DUST CITY

KNOW THY NEIGHBOURS

CENTRAL QUESTION

We don't live on this world alone. What do we actually know about the more-than-human (and human) neighbors?

MORNING

Short questionnaire about the crickets without looking at them first:

- sympathy
- interest
- connectedness
- individuality?
- Do they show responsibility towards each other?
- Do we feel responsible for them?

20-minute pure watching: no feeding, no touching, no interaction. Note concrete actions, behaviors and interactions, differences and reactions to each other.

Do the questionnaire again – did anything change?

AFTERNOON

Choose one thing in the Habitat — a plant, cricket, sensor, piece of furniture, water tank, robot, etc.

Describe the Habitat for 20 minutes entirely from that entity's perspective:

- What can it perceive?
- What does it depend on?
- What changes around it?
- What might it "know" about the astronauts?
- What would be important to it that humans overlook?

Then compare the different perspectives: What becomes visible when we stop taking the human perspective as the default?

EVA

Observe and document people on the MARS!platz:

- How do the people who pass through the marketplace differ from the people who work there / live nearby?
- Which relationships between people can we identify?
- Which forms of use of the place are there?
- Groups vs. individuals
- Optional interview: brief information about their perspective?

QUESTION FOR THE COMMUNITY HOUR

When does a stranger become a neighbor?
What makes a good neighborhood?

Wann wird aus einem Fremden ein Nachbar?
Was macht gute Nachbarschaft aus?

MATERIAL – WHAT DOES THIS NEED

Pen/Paper or laptop, voice recorder, the crickets, photo camera, maybe photo printer
